

Cutera Hair Removal

The Cutera Xeo Hair Removal Systems are part of a class 4 medical Laser system, which cannot be compared to an entry level Laser or IPL system for hair removal. CoolGlide® & ProWave™ are specifically tailored for all skin types and tones including tanned patients. Cutera's unique design, longer wavelength, and innovative cooling design, allow extremely effective, safe and permanent results.

What areas can be treated?

The Cutera Laser & IPL devices can remove hair from all parts of the body including the face, legs, arms, underarms, and back. They can also treat sensitive areas like the chest, nipples, and bikini line.

What do the treatments feel like?

The Cutera Laser and IPL handpieces cool and soothe as they glide along your skin. When the pulse of light is delivered, some patients experience a mild pinching or stinging sensation. No local anaesthesia or pain medication is typically required; however, some patients may prefer to use a topical anaesthetic when sensitive areas are treated.

How many treatments will I need?

Most areas require 4-6-8 treatments. However, the number of treatments required for optimal long-term benefits depends on multiple factors – hair thickness, the area treated and your hair's

growth cycle. Interestingly, not all hairs are actively growing at the same time and actually go through three distinct phases: growth, regression, and resting. Hair removal treatments work by disabling the hair that is principally in the active growth phase at the time of treatment. Since other hairs will enter this active growth phase at different times, additional treatments may be necessary to disable all of the hair follicles in a given area.

What happens after the treatment?

Immediately following your hair removal treatment, the area may appear a bit red and swollen. Three to seven days after treatment you may experience what seems to be regrowth of hair. Actually, most of these hairs are being shed as a result of your treatment and are not regrowing. Between treatments you should not wax or pluck your hair, but it is permissible to shave.

Are there any restrictions on my activity after treatment?

Following the treatment, you can return to your normal activities right away, but some redness may occur. The use of sunscreen is recommended on any treated areas exposed to the sun. In addition, your physician may recommend that you use a specially formulated skin care product line or prescribe a skin care regimen especially formulated for your skin type.

What are the possible side effects?

Although patients experience few side effects, the most commonly noticed are slight reddening and local swelling of the skin, similar to sunburn. These effects typically last for several hours or less. In rare instances, blistering may occur. Consult with your medical professional for complete information on the benefits and risks of treatment.

How do Cutera Laser & IPL compare with other hair removal methods?

Shaving, waxing, and depilatory creams are all temporary methods which must be repeated on a frequent basis. The Cutera systems offer permanent hair reduction for lasting results.

Why choose Cutera over other laser hair removal systems?

Using the latest technology in light based hair removal, the CoolGlide® and ProWave™ can rapidly treat large areas without the limitations of older technologies. The CoolGlide's longer wavelength allows it to be used safely and effectively on patients with dark skin as well as tanned skin. Unlike other systems, the CoolGlide and ProWave can treat finer hair on a woman's upper lip just as easily and effectively as the coarse hair on a man's back. The cooled handpieces increase patient comfort and minimize the adverse skin reaction commonly seen with other lasers.
