

## Lime Light™

LimeLight Facial is a new, non-invasive light-based procedure which addresses problems at the skin's surface related to ageing and photo damage (sun damage). The procedure offers an advantage of improving skin tone and texture by targeting imperfections like redness, mottled complexions, freckles and dark spots.

- *Benign pigmented lesions (sun/age spots)*
- *Vascular lesions*
- *Colour balance*
- *Improve overall complexion*
- *Poikiloderma of Civatte*
- *Offer 2D Revitalize Therapy procedure (including Laser Genesis)*

### How does it work?

Via the selection of different programs your Clinician is able to customize the treatment to your skin type and selectively treat brown and/or red pigments that give your skin a mottled appearance.

A light pulse will be emitted to the skin and the energy of this pulse will be absorbed by the target in the skin (vessels or the pigment) without impacting the surrounding tissue. This process is called selective Thermolysis. It is the heating of the target that causes the therapeutic effect.

### What areas can be treated?

The most popular areas for LimeLight treatment are the face, neck & décolletage, but other body parts such as the hands, arms and abdomen, are also frequently treated.

### Who can be treated & how many treatments will I need?

Men and women of any age who wish to improve their skin can be treated. Skin which has surface wrinkles, redness and brown spots are the most common conditions to treat. Each treatment program is different and customized to an individual patient's needs. Most patients can expect between 1-3 treatments.

### What do the treatments feel like?

LimeLight Facial delivers a single pulse to a series of pulses of light to the skin. With the delivery of each pulse a mild burning / pinching sensation can be felt, but an inbuilt cooling mechanism will minimise discomfort during the treatment. Your Clinician can offer additional pre and post cooling with a cold pack.

### What will happen after the treatment?

Immediately after the treatment the brown spots will start to become darker or greyish looking, whereas the surrounding skin might appear slightly red. The treated area can appear somewhat swollen which is completely normal and will subside within hours to days following treatment.

### When will I see results?

Immediate results are observed by some patients. The darkened areas will start to flake off and fade within 1-3 weeks after the treatment and improvements will continue for several months.

### Will the red and brown spots come back?

New pigmented lesions, spots and vessels may appear with new sun damage! It is crucial to protect the skin with a broad-spectrum Sunscreen of minimum 30 SPF, especially in Australia, to minimize damage and the development of further spots and redness. However, should new lesions occur they can also be treated.

### When is the best time to have the treatment done?

Because the LimeLight Facial is designed to treat sun damage, it is suggested to have the treatment performed in the months of the least sun exposure and ideally after summer. Please make sure you don't schedule your treatment right before a big event as you will need to accommodate healing time.
