

Intense Pulsed Light (IPL)
Systems are specially engineered for treating unwanted hair as well as enhancing skin texture and tone.

Our clinic provides you with a medical strength Intense Pulsed Light System which uses specialised hand pieces necessary for various treatments such as Photorejuvenation and Hair Reduction.

How does IPL work?

IPL systems are able to achieve hair reduction and skin rejuvenation by emitting short pulses of intense filtered light into the target areas.

When the light is absorbed into the target and converted into heat, it destroys the target which results in less hair growth or removal of blemishes and facial redness depending on the light filters and parameters selected.

These outcomes are achieved causing no or only minor visible skin damage, enabling you to return to normal activities almost immediately.

BROCHURE

Hair Reduction

IPL removes hair by sending out high intensity light pulses into the hair follicle, loosening the hair and disabling the cell responsible for new hair growth.

IPL works best at removing hair when it's in the active growth phase. But not all hair in the treatment area will be in this phase at any given time. So, we spread our IPL treatments out over a period of time and a number of treatments. This is to make sure that hair that isn't treated in one session is affected in one of the following treatments. The way hair grows is slightly different for everyone, so we tailor our treatment to suit you.

Prior to each hair removal treatment you will be required to shave or trim the treatment area. However, in some cases you may be asked not to shave or trim before the first treatment, as the consultant may need to assess the hair growth.

The treated hair will continue to appear for 7-20 days post treatment. This is not new hair growth but the treated hair being expelled from skin. For best hair removal results, avoid waxing or plucking the hair for four weeks prior to your treatment.

Photorejuvenation

IPL photorejuvenation is a non-invasive treatment which uses high intensity short pulses of light to penetrate the affected skin, targeting skin pigmentation and removing redness.

The Light energy creates heat which also firms the skin and shrinks pores resulting in a reduction in fine lines and wrinkles. The overall affect is an improvement in skin tone and texture making the skin appear more luminous, brighter and smoother.

Results are noticeable 2-3 weeks after the first treatment, you will wonder why you waited!

Photorejuvenation usually requires around 2-4 treatments. There is some darkening of the pigmented areas for about 10 days post treatment.

Are IPL treatments safe?

The quality of the equipment and experience level of the operators have dramatically increased over the last ten years. Our operators are trained to use IPL technology and are extremely capable of providing you with full guidance and support through to full recovery after the treatment.

Usually, there is some redness and a mild sunburn sensation which may last for an hour or more after the treatment.

Avoid sun exposure or solarium for four weeks prior to, or two weeks after the first or subsequent sessions. Do not self-tan for four weeks prior to the first or subsequent sessions.

Are IPL treatments painful?

There is a small amount of discomfort associated with IPL and the treatment is often described as rubber band snapping on the skin.

The medical strength IPL system our clinic employs has a cooling device on the hand piece for increased comfort and safety.

Treatment is a cosmetic treatment and no medical claims are expressed or implied.
