Micropigmentation
(Tattooing)

Love & Heal the Skin You're in...

2022

Micropigmentation (Microblading)

Micropigmentation is also known as Semi-Permanent Makeup, Dermatography or Cosmetic Tattooing.

As the name suggests, it is a type of tattooing for cosmetic & medical purposes where minute pigment particles are placed below the Epidermis (the upper layer of our skin) to either aesthetically correct, reconstruct or camouflage features and imperfections.

The treatment is performed in a clinical environment, with medical grade equipment, dermatological tested pigments and the use of sterile/disposable utensils.

Cosmetic Micropigmentation

Cosmetic Micropigmentation or 'Semi-Permanent Makeup' in form of **brow feathering/hairstrokes** (microblading), **lash enhancement**, **eyeliner** tattooing and **lip lines** and blends are the perfect solution for anyone with a busy lifestyle and would like to 'wake up in their Makeup' New cosmetics like long lasting mascara; brow powders and pencils; or lipstick are in trend, but they still don't last as long as we would like them to and are certainly not 'touch proof'.

WHO WOULD BENEFIT FROM MICROPIGMENTATION?

- Individuals that have a busy lifestyle and don't have the time to apply 'their face' constantly.
- Athletes and sportive people that still want to look fresh while working out without having make up that smudges or sweats off.
- Someone with visual impairment or other disabilities that is unable to apply Makeup.
- People suffering with hair and / or pigment loss due to medication, disease, trauma or genetics (e.g. Alopecia, Vitiligo, Accidents etc.)
- Someone who's suffering with Asymmetrical features and want to make uneven areas appear balanced or more equal in size such as eyebrows, borders of the lips, or areolas.
- Or someone with an unsteady hand or disability like MS, Arthritis or Stroke survivors.

Medical Micropigmentation

This specialised technique can be applied in many ways to reduce the appearance of scars from accidents, burns, surgery or repair the appearance of congenital disorders such as cleft palate.

Micropigmentation can also help to reconstruct and camouflage skin tones and hair in people with skin diseases such as **Vitiligo** or **Alopecia**, as well as other pigment and hair related disorders.

Hair reconstruction helps to restore the appearance of missing hair lost due to disease, trauma, or natural thinning (**Cancer, Alopecia or Trichotillomania**).

Post-Operative Micropigmentation is a great opportunity for those who suffered from **Breast cancer** and have undergone Mastectomy (full/partial). There are many ways to surgically reconstruct the Areola Nipple Complex (ANC), but unfortunately the tissue (Skin graft) used to do this is rarely the same colour and structure as the areola was before the operation. Micropigmentation can create a **3 dimensional nipple and/or areola** on the newly reconstructed breast.

The appearance of **incision scars** from surgeries (augmentation, reduction, and breast lift) can also be masked as well as a colour match to an already existing areola nipple complex.
